

ABSTRACT OF THE DISCLOSURE

A system and method for providing a presentation system configured to project an image of an object to a projection surface. The presentation system includes a computer, a digital camera and a digital projector. The computer includes a processor operable to process a digital
5 real-time image. The digital camera is operatively coupled to the computer. The digital camera is oriented toward a desired object to digitally capture a real-time image of the desired object and to transfer the real-time image to the computer to process the real-time image. The digital projector is operatively coupled to the computer. The digital projector is operable to receive the
10 real-time image directly from the computer and to project the real-time image to the projection surface on an enlargeable scale for viewing by one or more viewers.
